

Cleaning plastic windows – how to keep coated window frames looking good for a long time

Painted plastic windows are considered particularly robust and durable. However, they also require regular maintenance: sun, rain, dirt and exhaust fumes take their toll on the surfaces over time. To ensure that your coated plastic window frames remain beautiful for a long time, proper cleaning and professional care are essential.

Steps

Cleaning coated plastic windows – Step 1: Thorough cleaning

First remove dust and surface dirt with lukewarm water and a mild detergent. Then allow to dry briefly. For deep cleaning, apply **ADLER Top-Cleaner** evenly to the plastic frames with the yellow cloth. Leave to take effect for a short time, then rinse thoroughly with clean, warm water.

Caring for coated plastic windows – Step 2: Apply protection

&Once the window frames are completely dry, proceed with maintenance: Apply **ADLER Top-Care** thinly with a blue cloth and spread evenly. The care product seals fine pores in the coating film and repels water. This ensures that your coated plastic windows remain permanently protected and look almost as good as new.

Tip: Clean surface-treated plastic windows regularly.

To keep your glazed and opaque coated windows looking good in the long term, we recommend using the **ADLER Window Care Set** once or twice a year. The cleaning cloths are reusable and can be easily washed out with water and a little soap.

Advantages of ADLER Window Care:

- Suitable for glazed and opaque coated window frames
- Seals micro-fine cracks and pores in the paint or glaze finish film
- Repels water, oil and dirt for long-lasting protection
- Can be easily overpainted
